We prove the existence of global solutions to the Euler equations of compressible isentropic gas dynamics with geometrical structure, including transonic nozzle flow and spherically symmetric flow. Due to the presence of the geometrical source terms, the existence results themselves are new, especially as they pertain to radial flow in an unbounded region,  $(|\vec{x}| \geq 1)$ , and to transonic nozzle flow.

Compressible flow effects are encountered in numerous engineering applications involving high speed flows and/or flows with large pressure differences, e.g. gas turbines, steam turbines, internal combustion engines, Stirling engines, rocket engines, high-speed aerodynamics, high speed propellers, gas pipe flows, etc. In fact, modern society with its dependence on fast ground and air transportation as well as reliable electricity generation would not function without compressible flow.

Compressible flow (or gas dynamics) is the branch of fluid mechanics that deals with flows having significant changes in fluid density. While all flows are compressible , flows are

usually treated as being incompressible when the Mach number (the ratio of the speed of the flow to the speed of sound) is less than 0.3 (since the density change due to velocity is about 5% in that case). [1]

This book deals with an introduction to the flow of compressible substances (gases). The main difference between compressible flow and almost incompressible flow is

not the fact that compressibility has to be considered. Rather, the difference is in two phenomena that do not exist in incompressible flow. The first phenomenon is the very sharp discontinuity (jump) in the flow in properties.

In fact, the shallow-water equations accept solutions of elevation and depression waves that are analogous to compression and rarefaction waves in gas dynamics. This analogy has led to benefits to both branches of fluid mechanics.

The solution of gas flow systems becomes more complex when dealing with gas mixtures and large systems. It is recommended that a suitable software tool should be selected to design and solve gas flow systems in an attempt to eliminate the potential for errors resulting from the simplification of ideal gas flow.
